Forklaringer til tabeller

"Tidevandstabeller for grønlandske farvande 2025" er udarbejdet af Danmarks Meteorologiske Institut (DMI) med brug af harmoniske tidevandskonstituenten beregnet af DMI og/eller Farvandsvæsenet.

Tidevandstabellerne viser tidspunkter for høj- og lavvande samt de tilhørende tidevandshøjder, for havnene anført i indholdsfortegnelsen på side 2. Tidspunkter og højder er beregnet ved hjælp af harmoniske konstituenten. Konstituenten er beregnet udfra lange kvalitetssikrede vandstandstidsserier. Rækkefølgen af tabellerne er geografisk sorteret med uret rundt om Grønland.

Tidspunkterne for høj- og lavvande er angivet i **ny vestgrønlandsk normaltids, som er UTC (Coordinated Universal Time) - 2 timer**. Når sommertid gælder, skal de angivne tidspunkter øges med 1 time (UTC - 1 time). Tidevandshøjderne er angivet i meter i forhold til **kortnul, som er laveste astronomiske tidevand (LAT)**. Tidevandshøjderne skal således lægges til dybden i søkortet for at give dybderne ved høj- og lavvande.

Ønskes tidevandshøjderne angivet i forhold til middelvandstand, adderes den negative LAT-værdi. Herved bliver højvande generelt positive og lavvande tilsvarende negative. Den lokale LAT-værdi er angivet som en negativ konstant i toppen af hver tidevandstabel.

LAT er beregnet som den laveste tidevandsprediktion beregnet over perioden 1997-2016 (begge år inklusive). Høj- og lavvande er bestemt som lokale ekstrema, hvor forskellen mellem høj- og lavvande har minimum samme størrelse, som amplituden af solens primære halvdaglige konstituent S₂. For meget komplekst tidevand kan det betyde, at tidevandets primære periode skifter fra halvdagligt til dagligt omkring nip-tide, hvor udsvinget af tidevandet er mindst.

Det understreges, at tabellerne kun beskriver de vandstandsændringer, som skyldes solens og månens tiltrækningskraft (astronomisk tidevand). De betydelige, og ofte dominerende ændringer, i vandstanden, som skyldes meteorologiske og oceanografiske forhold (vind, barometerstand, strøm o.l.), indgår således ikke i tabellernes opgivne vandstand.

Explanation of tables

"Tide tables for Greenlandic waters 2025" is prepared by the Danish Meteorological Institute (DMI) using harmonic tidal constituents calculated by DMI and/or the Danish Maritime Safety Administration.

The tide tables list the times for high and low water and the corresponding high and low tidal water heights, for the ports listed in the table of content on page 2. The times and heights are calculated using harmonic constituents. The constituents are calculated using long time quality checked time series of water level. The order of the tide tables are geographical sorted clockwise around Greenland.

The times for high and low water are given in new West Greenland standard time, which is **UTC (Coordinated Universal Time - 2 hours)**. When summer time applies, one hour should be added (UTC - 1 hour). Tidal heights are in meters relative to **chart datum which is lowest astronomical tide (LAT)**. Tidal heights should be added to the depth shown in the chart to obtain the water depths at high and low tide.

Tidal height referred to mean water level is obtained by adding the negative LAT value. Hereby high tidal water is generally positive and low tidal water is correspondingly negative. The local LAT value is given as a negative constant at the top of each tide table.

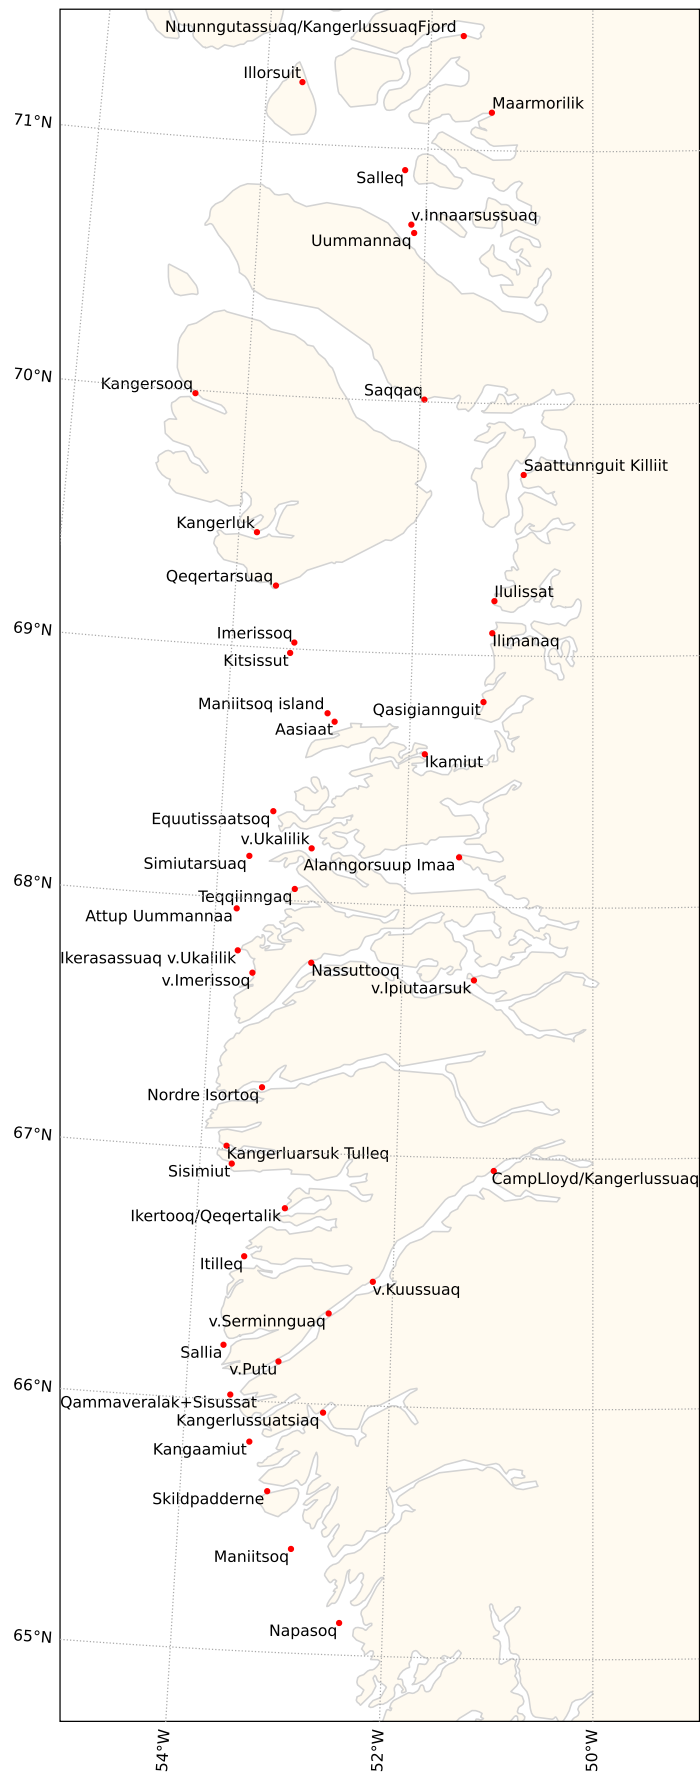

LAT is calculated as the lowest tide water prediction calculated over the time period 1997-2016 (both years included). High and low water is given as local extrema, where the range between high and low water is at least the same size as the amplitude of the primary solar semidiurnal tidal constituent S2. For very complex tides, the primary period can change from semidiurnal to diurnal tides around neap tide, corresponding to the lowest tidal range.

Notice that the tables reflect only the changes in water level caused by the gravitational forces from the sun and the moon (astronomic tide). The considerable, and often dominating, changes in water level caused by meteorological and oceanographic conditions (wind, barometric pressure, currents, etc.) are not included in the tables of the actual water levels.
